

TACANO KIT-10

Prive TACANO

● Tactical GSM anonymizer

GSM anonymizer is a patent pending stand alone robust hardware device for tactical protection against various GSM network based intelligence activities. TAC ANO is small embedded unit to protect mobile communication from link analysis and traffic pattern mapping between communication parties.

These units offers isolation between communication parties when there is extensive rogue SS7 services available and illegal IMSI Catching activities in GSM networks. Unit offers operational security screening

when operations are conducted on foreign soil or between actors who are not supposed to get connected under any circumstances. TAC ANO unit primary usage is in informant handling operations in law enforcement or intelligence operations, where no direct link between informant and handler cannot be exposed under any circumstances.

TAC ANO units can be used also on sensor data delivery, where source of information will never reveal destination (receiver) party. Sensors can be Tracking Devices or other GSM network accessed remote controlling activities. Operations under hostile network environments will never expose actors or destinations of communication using this link.

Features

- SMS & Voice Call communication anonymization
- Timing randomization (Δt)
- Operational GSM power off schemes
- Local configuration with SIM cards
- Local configuration with SIM cards

Typical end user segments

- asset SS7 intelligence protection
- M2M communication anonymization.
- Tracking Device OPSEC
- Informant SMS communication
- Team communication protection in hostile networks
- VIP Protection

Hardware specifications

- Black anodized aluminum, size: 70 x 64 x 23 mm
- 3.6 V / 1700 mAh rechargeable battery
- Micro USB charger input
- SMA Antenna connectors
- User mountable Micro SIM cards
